IT Inventory Management System

To manage equipment in any organization, the organization must track and trend all historical repair and failure information on that equipment. IMS® is the tracking and analytical equipment management software tool designed specifically to maintain Grants, Project and inventories of Main organization and sub-organization, track the trends and analyze the solutions.

As an information technology tool designed for everyday assistance to maintenance, planning and purchasing, IMS® fills the bill as the user-friendly electronic equipment software engineered to help you make effective decisions.

Rather than just being a one-dimensional equipment or accounting software tool, IMS® can expand its tracking and trending capabilities to effectively watch over any warranty repairable asset in your IT Stores. There is virtually no need to return to the programmers for adaptability. IMS®'s developers made it simple for any user to change the category of asset requiring your daily attention.
